# Discharge Advice for Patients Following Removal of an Implantable Loop Recorder (ILR)

After your discharge from hospital following the above procedure, please take note of the following care advice:

- Check your wound site daily for any signs of bleeding, swelling (swelling can mean that it is bleeding underneath the skin) or infection (redness, hot to touch, oozing). Contact the Cardiology day ward **immediately** on 01305 254990 and you will be asked to come in to have the wound checked. If it is out of our hours, go to the Emergency Department
- It is important that you limit the use of your arm on the same side as the device for **one week**. Do not use it to push, pull or carry heavy objects. This is to allow the wound site to heal
- The clear, protective dressing should remain in place until the stitch is removed or for seven days. The dressing is 'splash proof' so you can shower, but you should avoid standing in the full flow of water to prevent the dressing lifting up as this can risk infection. If it does start to peel up at the edges, please see your practice nurse at the GP surgery to have it renewed
- Avoid having a bath or going swimming until the stitch has been removed and the wound is healed and dry
- If you have a removable stitch, you will need to make arrangements for this to be removed at the GP surgery in seven days. If you have concerns regarding your wound site, please contact the Cardiology day ward on 01305 254990. If you have steri-strips to the wound site, you can remove these after seven days.
- It is normal for the wound site to be bruised and uncomfortable initially. Please take 1-2 Paracetamol 500mg tablets 4 to 6-hourly and always follow the instructions on the packaging.

**For any further advice please contact the Cardiology day ward on 01305 254990, Monday – Friday between 8am and 6pm.**

## Feedback

If you are happy with the service provided within this department, or if you feel we could improve this service, we would be grateful for your feedback.
